Application Narrative for Proposed Equipment

Proposed Program

We are requesting use of a GPS repeater system for our product development and installation center. We have a number of aircraft components that we research and test for our clients. We conduct testing and data research on a number of components which require a GPS connection in order to produce test results. Our testing instruments and workstations are located inside the facility and cannot be moved, thus the need for the repeater. After compiling the research results, we create a custom recommendation for the client, receive approval from the client, and then install the new components in the aircraft. We conduct another round of testing after the installation has been completed to ensure the components are functioning properly.
