

Explanation the TAGSAT-2 Experiment Status

The NSL Tag concept will allow continuous near real time tracking of the location of a spacecraft, and support precision TLEs for low Earth orbit satellites.

TAGSAT-1 was the initial effort at achieving space heritage for this design. We are currently gathering data from it.

TAGSAT-2 will continue the experiment. A different form factor will be used, and a number of software changes will be tested.

TAGSAT-1 and TAGSAT-2 are not part of a constellation, they are separate, distinct experimental demonstrations of an evolving design. They are experiments, not commercial activities. They support refinement of a design that is expected to evolve into a commercial product, which will be purchased for use by many spacecraft operators.
