

Exhibit 1 for FCC Experimental License Request. File#: 0119-EX-PL-2009 . Submittal is identical for previous expired license WD2XBD, with 0070-EX-ML-2003 which modified 0269-EX-PL-2002 to add the Largo Raytheon location in 0239-EX-RR-2006. All under FRN# 0007-9402-40

No changes to the original license Exhibit 1 technical information, submitted again herein as a part of the new license request.

Test methods, frequencies and setups planned for the shielding evaluation of multiple structures at the St. Petersburg and Largo site were determined using IEEE STD 299-1997.

IEEE Standard Method for Measuring the Effectiveness of Electromagnetic Shielding Enclosures, as a guide.

Test equipment used for tests may be replaced with suitable equivalent equipment due to availability.

Tx signal sources and antennas are listed below. Rx equipment consists of same model antenna connected to a HP 8562A (1k-22GHz) or equivalent spectrum analyzer.

Polarity key: LHC = Left-hand circular

V = Vertical
H = Horizontal

		Frequency list using IEEE STD 299-1997 as a guide.	Freq. Units	Modulation	Output waveform type	Tx and Rx Antenna #s	EIRP Peak, CW. Based on AF (1 meter) and source Pout.	EIRP Peak, CW = dB Watts + dB Gain	EIRP conversion of EIRP dBW into milliwatts	ERP dBW	ERP milliwatts	ERP License Value (mW)	margin to EEEEC Action Level	Does License emission value Exceed EEEEC Action Levels?	EIRP converted to mW/cm ²	EEEC Action Level (mW/cm ²)	Ant. Gain	Signal source, signal generator	Signal source power out (dBm)	Signal source power out 1E-3 Watts	Polarity used in testing

NOTE: convert from EIRP to ERP

- 2.16 dB

See file on comparison of ERP to EIRP - excerpt below:
"antenna info - ERP.PDF" on D drive.

6/ 13/ 98 Wireless Information Networks 143
Reference Antennas
ERP and EIRP
• ERP is by comparison to a Dipole
– This is the standard in cellular, land mobile, HF communications, and FM/ TV broadcasting
• EIRP is by comparison to an Isotropic Radiator
– This is the tradition in PCS at 1900 MHz, point-to-point microwave, satellite communications, and radar.
• ERP values can be converted to EIRP and vice versa. For a given amount of power input, a dipole produces 2.16 dB more radiation than an isotropic radiator, due to the dipoles slight directionality.
• ERP dB = EIRP dB - 2.16 dB
• ERP Watts = EIRP Watts /1.64
