Remark:
1. *The maximum output power is* <u>*19.83dBm (96.16mW) at 2462MHz (with 1.58 numeric antenna gain*</u>*.)*
2. *DTS device is not subject to routine RF evaluation; MPE estimate is used to justify the compliance.*
3. *For mobile or fixed location transmitters, no SAR consideration applied. The maximum power density is 1.0 mW/cm2 even if the calculation indicates that the power density would be larger.*

TEST RESULTS

No non-compliance noted.

Calculation

Given $\quad E = \dfrac{\sqrt{30 \times P \times G}}{d} \quad \& \quad S = \dfrac{E^2}{3770}$

$\qquad$ *Where* $\quad$ *E = Field strength in Volts / meter*

$\qquad\qquad\quad$ *P = Power in Watts*

$\qquad\qquad\quad$ *G = Numeric antenna gain*

$\qquad\qquad\quad$ *d = Distance in meters*

$\qquad\qquad\quad$ *S = Power density in milliwatts / square centimeter*

Combining equations and re-arranging the terms to express the distance as a function of the remaining variables yields:

$$S = \frac{30 \times P \times G}{3770 d^2}$$

Changing to units of mW and cm, using:

$\qquad$ *P (mW) = P (W) / 1000 and*

$\qquad$ *d (cm) = d(m) / 100*

Yields

$$S = \frac{30 \times (P/1000) \times G}{3770 \times (d/100)^2} = 0.0796 \times \frac{P \times G}{d^2} \quad \textbf{\textit{Equation 1}}$$

$\qquad$ *Where* $\quad$ *d = Distance in cm*

$\qquad\qquad\quad$ *P = Power in mW*

$\qquad\qquad\quad$ *G = Numeric antenna gain*

$\qquad\qquad\quad$ *S = Power density in mW / cm²*

Maximum Permissible Exposure

Substituting the MPE safe distance using d = 20 cm into Equation 1:

Yields

$\quad S = 0.000199 \times P \times G$

Where $\quad$ *P = Power in mW*

$\qquad\qquad$ *G = Numeric antenna gain*

$\qquad\qquad$ *S = Power density in mW / cm²*
