|-------------|--|----|
| APPENDIX G: | TEST EQUIPMENT USED TO PERFORM THE TEST1 | 45 |

#### **Section 1: Overview**

#### **Test Summary**

The samples were assessed against the tests detailed in section 3 under the requirements of the following standards:

#### **Emissions:**

CFR47 Part 15.247 RSS-210

#### Notes:

- 1) Where a specification listed on the front cover of this report has deviations from the basic standards listed above, the additional technical requirements of the specification were also assessed.
- 2) Where appropriate, Cisco may have substituted a later revision of a basic standard to those referenced in the specification on the front sheet of this test report. This decision was based upon improved test methodology and repeatability and/or where the newer revision represented a more stringent test.
- 3) Where relevant, testing has been carried out to the requirements of both EN and IEC Specifications. This was possible because of the similarities of the test methods involved and the Cisco EMC test procedures.
- 4) For Radiated and Conducted emissions results refer to section 2.9 for measurement uncertainty considerations
- 5) Where applicable, details of the precise distance used when performing radiated immunity measurements can be found in Cisco document EDCS-221012.
- 6) Where testing has been performed to EN61000-4-3, additional measurements were conducted to establish the field strength at a 40cm height in both the horizontal and vertical antenna polarities (applies to floor standing EUT's only). This field strength data can be found in Cisco document ENG-72588.

## **Section 2: Assessment Information**

#### 2.1 General

This report contains an assessment of an apparatus against Electromagnetic Compatibility Standards based upon tests carried out on the samples submitted.

This report must not be used to claim product certification, approval, or endorsement by A2LA, NIST, or any agency of the federal Government.

This report may contain data that are not covered by the A2LA accreditation (Certificate number 1178-01). Please refer to Appendix F for further details.

With regard to this assessment, the following points should be noted:

- a) The results contained in this report relate only to the items tested and were obtained in the period between the date of the initial assessment and the date of issue of the report. Manufactured products will not necessarily give identical results due to production and measurement tolerances.
- b) The apparatus was set up and exercised using the configuration and modes of operation defined in this report only.
- c) Where relevant, the apparatus was only assessed using the susceptibility criteria defined in this report and the Test Assessment Plan (TAP).
- d) All testing was performed under the following environmental conditions:

Temperature 15°C to 35°C (54°F to 95°F)

Atmospheric Pressure 860mbar to 1060mbar (25.4" to 31.3")

Humidity 10% to 75\*%

\*[Where applicable] For ESD testing the humidity limits used were 30% to 60% and for EFT/B tests the humidity limits used were 25% to 75%.

e) All AC testing was performed at one or more of the following supply voltages:

110V (+/-10%) 60Hz

220V (+/-10%) 50 or 60Hz

f) Cisco Systems Inc., are accredited by the American Association for Laboratory Accreditation (A2LA). For the specific scope of accreditation under certificate number 1178-01.see appendix F for further details.

This report must not be reproduced except in full, without written approval of Cisco Systems.

# 2.2 Date of start of testing

25-Apr-2005

## 2.3 Report Issue Date

Cisco uses an electronic system to issue, store and control the revision of test reports. This system is called the Engineering Document Control System (EDCS). The actual report issue date is embedded into the original file on EDCS. Any copies of this report, either electronic or paper, that are not on EDCS must be considered uncontrolled

# 2.4 Testing facilities

This assessment was performed by:

## **Testing Laboratory**

Cisco Systems, Inc., 170 West Tasman Drive San Jose, CA 95134, USA

## **Test Engineers**

James Nicholson

## 2.5 Equipment Assessed (EUT)

AIR-AP1242AG-x-K9 Cisco Aironet 1242AG Series IEEE 802.11a/b/g Access Point

## 2.6 EUT Description

The AIR-AP1242G-A-K9 access point operates in both 2.4 GHz spectrum, to provide data rates up to 54 Mbps in accordance with the IEEE 802.11g standard, including backwards compatibility to 802.11b. AIR-AP1242G-A-K9 supports both inline power and local power, and ships with a power supply brick.

FCC ID: LDK102066, Canada: 2461B-102066

## 2.7 Scope of Assessment

Tests have been performed in accordance with the relevant Test and Assessment Plan (TAP), a copy of which is contained in Appendix H of this report, and the relevant Cisco EMC compliance test procedures (ENG-23438). This test report may not cover all of the tests highlighted in the test plan.

#### 2.8 Units of Measurement

The units of measurements defined in the appendices are reported in specific terms, these are test dependent. Where radiated measurements are concerned these are defined at a particular distance. Basic voltage measurements are defined in dBuV and current in dBuA.

As an example, the basic calculation for all measurements is as follows:

Emission level [dBuV] = Indicated voltage level [dBuV] + Cable Loss [dB] + Other correction factors [dB]

The components of factors are dependent upon the exact test configurations [see test equipment lists for further details] and may include:-

Antenna Factors, Pre Amplifier Gain, LISN Loss, Pulse Limiter Loss, Current Probe Factors.

Note: to convert the results from dBuV/m to uV/m use the following formula:-

Level in uV/m = Common Antilogarithm [(X dBuV/m)/20] = Y uV/m

#### 2.9 Measurement Uncertainty

Where relevant measurement uncertainty levels have been estimated for tests performed on the apparatus. This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of k=2.

Radiated emissions (expanded uncertainty, confidence interval 95%)

| 10kHz - 30 MHz     | +/- 2.8 dB ( E Field) |
|--------------------|-----------------------|
| 10kHz - 30 MHz     | +/- 2.8 dB ( H Field) |
| 30 MHz - 300 MHz   | +/- 3.8 dB            |
| 300 MHz - 1000 MHz | +/- 4.3 dB            |
| 1 GHz - 10 GHz     | +/- 4.0 dB            |
| 10 GHz - 18GHz     | +/- 8.2 dB            |
| 18GHz - 26.5GHz    | +/- 4.1 dB            |
| 26.5GHz - 40GHz    | +/- 3.9 dB            |

Conducted emissions (expanded uncertainty, confidence interval 95%)

| 4 kHz - 30 MHz  | +/- 2.2 dB (using Current Probe) |
|-----------------|----------------------------------|
| 9 kHz - 150 kHz | +/- 4.1 dB (using LISN)          |
|                 | Page No. 7 of 150                |

EMC Test Report No: EDCS -

FCC ID: LDK102066, Canada: 2461B-102066

10 kHz - 30 MHz +/- 2.6 dB (using Current Probe)

150 kHz - 30 MHz +/- 3.7 dB (using LISN) 150 kHz - 30 MHz +/- 3.1 dB (using CDN)

150 kHz - 30 MHz Under Consideration (Using CVP-1)

Conducted Immunity (expanded uncertainty, confidence interval 95%)

10 kHz - 30 MHz +/- 0.9 dB (using bulk current injection)

Radiated Immunity (expanded uncertainty, confidence interval 95%)

ESD, EFT/B and Surge tests

The tests are performed within the tolerance specified by IEC61000-4-2, IEC61000-4-3 and IEC61000-4-5 respectively

A product is considered to comply with a requirement if the nominal measured value is below the limit line. The product is considered to not be in compliance in case the nominal measured value is above the limit line. For further explanation refer to Cisco Systems Inc Measurement Uncertainty Document: ENG-4001 8

# 2.10 Report Template Revision No.

Revision: CRA 12.0

# **Section 3: Sample Details**

Note: Each sample was evaluated to ensure that its condition was suitable to be used as a test sample prior to the commencement of testing. Please also refer to the "Justification for worst Case test Configuration" section of this report for further details on the selection of EUT samples.

# 3.1 Sample Details

| Sample<br>Number | Equipment Details | Serial Number | Part<br>Number |
|------------------|-------------------|---------------|----------------|
| S01              | AIR-AP1242AG-A-K9 | FHH0916W088   |                |
| S02              | AIR-ANT2410Y-R    |               |                |
| S03              | AIR-ANT3549       |               |                |
| S04              | AIR-ANT1728       |               |                |
| S07              | 34-1977-03        |               |                |

The following antennas are included in this filing:

| AIR-ANT1728 | 2.4 GHz 5.2 dBi Omnidirectional |
|-------------|---------------------------------|
| AIR-ANT2506 | 2.4 GHz 5.2 dBi Omnidirectional |

AIR-ANT4941 2.4 GHz 2.2 dBi Dipole

AIR-ANT5959 2.4 GHz 2.0 dBi Diversity Omnidirectional

AIR-ANT2485P-R 2.4 GHz 8.5 dBi Patch

AIR-ANT2465P-R 2.4 GHz 6.5 dBi Diversity Patch

AIR-ANT2460P-R 2.4 GHz 6.0 dBi Patch AIR-ANT2410Y-R 2.4 GHz 10.0 dBi Yagi

# 3.2 System Details

| System # | Description  | Samples          |
|----------|--|------------------|
| 1        | AIR-AP1242AG-A-K9 with 2.4GHz 10dBi Yagi Antenna             | S01, S02 and S07 |
| 2        | AIR-AP1242AG-A-K9 with 2.4GHz 8.5dBi Patch Antenna           | S01, S03 and S07 |
| 3        | AIR-AP1242AG-A-K9 with 2.4GHz 5.2dBi Omnidirectional Antenna | S01, S04 and S07 |
| 7        | AIR-AP1242AG-A-K9  | S01 and S07      |

# 3.3 Mode of Operation Details

| Mode# | Description      | Comments                                     |  |
|-------|------------------|--|--|
| 1     | 2.4GHz Band Edge | 2.4 GHz Band edge tests                      |  |
| 2     | 2.4GHz Spurious  | GHz Spurious 2.4GHz Spurious Emissions Tests |  |
| 6     | Conducted Tests  | Radio parameter conducted tests              |  |

EMC Test Report No: **EDCS -** FCC ID: LDK102066, Canada: 2461B-102066

# **Section 4: Modifications**

# **4.1 Sample Modifications Performed During Assessment**

No modifications were performed during assessment.

Title: 2.4GHz 10dBi Yagi Antenna

EMC Test Report No: EDCS -

FCC ID: LDK102066, Canada: 2461B-102066

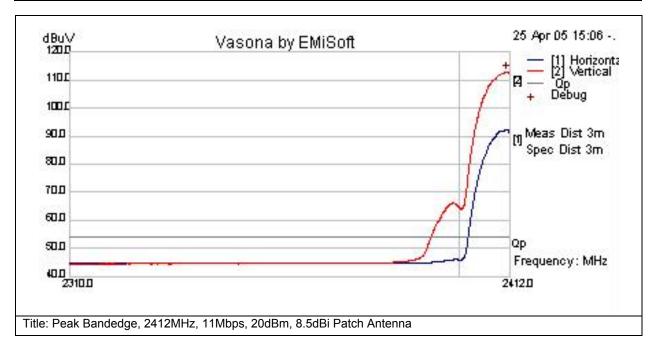

# 2.4GHz Radiated Bandedge with 8.5dBi Patch Antenna

| Test Number:         | 16140                  |                 |                   |  |
|----------------------|------------------------|-----------------|-------------------|--|
| Basic<br>Standard    | Applied to             | Class           | Freq Range        | Test Details / Comments  |
| CFR47 Part<br>15.247 | Enclosure              | N/A             | 1GHz - 26GHz      | Radiated emissions which fall in the restricted bands, as defined in Sec. 15.205(a), must also comply with the radiated emission limits specified in Sec. 15.209(a). |
| Operating<br>Mode    | <b>Mode :</b> 1, 2.4Gl | Hz Band Edge    |                   |  |
| Power Input          | 110v (+/-10%),         | 60Hz            |                   |  |
| Overall<br>Result    | Pass                   |                 |                   |  |

Title: 18-40GHz Radiated, 2.4GHz 10dBi Yagi Antenna

### **Maximum Permissible Exposure (MPE) Calculations**

Given

 $E=\sqrt{(30*P*G)}/d$  and  $S=E^2/3770$ 

where

E=Field Strength in Volts/meter

P=Power in Watts

G=Numeric Antenna Gain

d=Distance in meters

S=Power Density in mW/cm<sup>2</sup>

Combine equations and rearrange the terms to express the distance as a function of the remaining variables:

 $d=\sqrt{((30*P*G)/(3770*S))}$ 

Changing to units of power in mW and distance in cm, using:

P(mW)=P(W)/1000

d(cm)=100\*d(m)

yields

 $d=100*\sqrt{((30*(P/1000)*G)/(3770*S))}$ 

 $d=0.282*\sqrt{(P*G/S)}$ 

where

d=Distance in cm

P=Power in mW

G=Numerica Antenna Gain

S=Power Density in mW/cm^2

Substituting the logarithmic form of power and gain using:

 $P(mW)=10^{(P(dBm)/10)}$   $G(numeric)=10^{(G(dBi)/10)}$ 

yields

d=0.282\*10^((P+G)/20)/√S

Equation (1)

where

d=MPE distance in cm

P=Power in dBm

G=Antenna Gain in dBi

S=Power Density in mW/cm<sup>2</sup>

Equation (1) and the measured peak power is used to calculate the MPE distance. Note that for mobile or fixed location transmitters such as an access point, the minimum separation distance is 20 cm even if the calculations indicate that the MPE distance may be less.

S=1mW/cm<sup>2</sup> maximum. The highest 2.4GHz antenna gain supported is 10 dBi, and the highest 5 GHz antenna gain is 9.5 dBi. Using the peak power levels recorded in the test report along with Equation 1 above, the MPE distances are calculated as follows.

|           |          |           | Peak     |         |          |       |        |

#### Appendix D: Radiated Emissions Test Procedure

The following is a summary of the actual test procedure used by Cisco Systems (Doc No: ENG-36583)

#### **Pre-Assessment**

The object of the Pre-Assessment Testing is to identify emissions that must be evaluated against the specification limit, under conditions called out in the applicable specification. During this type of testing the repeatability of the test setup and the worst-case layout of the EUT are also determined..

- 1. Arrange the EUT in the chamber as defined in the configuration section of ENG-36583, the TAP and the appropriate specification.
- 2. Where the EUT cannot be configured in accordance with the specification then carry out the following:
  - i. Set the equipment up as close as possible to the requirements.
  - ii. Note within the logbook any deviations from the ard.
  - iii. Use only non-metallic supports.
  - iv. Ensure that the set up used is repeatable.
  - v. Evaluate the effect of the configuration upon the test results.
- 3. Set the antenna to EUT distance to the appropriate test distance.
- 4. An initial scan of the frequency ranges should be undertaken to ensure that all emissions emanate from the EUT and are not ambient (from mobile phones, support equipment etc).
- 5. The EUT should be evaluated in the mode(s) of operation defined in the TAP.
- 6. Measure the emissions profile of the EUT over the required frequency range using the Automated test software
- 7. Once an initial preview scan has been performed the emissions profile of the EUT should be maximized in accordance with the specification.
- 8. Repeat the preview scan after maximizing (unless the overhead cable rack has been utilized). Compare the results with the initial scan to ensure that the worst-case profile has been obtained. \*IMPORTANT\* If the obtained profiles are considerably different an investigation should be undertaken to ensure that there is not an intermittent problem with the EUT or its cabling.
- 9. If the obtained profiles are similar all emissions within 6dB of the test specification should be identified for formal measurements. If the test software is used to do this then the results must be confirmed manually. Where there are <6 emissions within 6dB of the specification, the worst six emissions should be identified.</p>
- 10. Where the frequencies of emissions are close together care must be taken to ensure that the actual worst case emission has been chosen for the formal measurement. This can usually only be confirmed by

maximizing the emission profile. If in doubt identify both (or all) suspect emissions near the center frequency identified by the preview software.

- 11. During testing the overload indicator of the test Rx should be monitored to ensure that the testing is valid. Where an overload condition is suspected this can normally be confirmed by the use of an external attenuator or the Rx linearity function.
- 12. If no signals are within 20dB of the specification limit no formal measurements are required. If this happens the equipment setup should be re-checked to ensure that that it has not developed a fault. When testing to CNS13438 the worst 6 emissions should be recorded regardless
- 13. Repeat the preceding for the remaining Modes and Configurations defined by the TAP or until a worst-case configuration has been obtained. Plots must be made of the worst case emission profile for inclusion in the test report. Plots may also be taken of other representative profiles.

#### Formal Testing:

The object of Formal/Final measurements is to formally measure the emissions highlighted during the preassessment phase against the appropriate specification limits. Maximization of the configuration of the EUT should not be performed during this phase as maximizing the profile at one frequency may change the profile at another and as such invalidate the preview results

- 1. In the **worst case configuration** each emission identified in the pre-assessment phase should be measured against the appropriate specification limit with the appropriate detector:
  - i. Quasi-Peak detector for emissions from 30 MHz to 1GHz
  - ii. Peak detector and average detector for emissions above 1GHz
- 2. Fine Tune the frequency of the emission.
- 3. The emissions should be observed for a sufficient period of time to allow the EUT to undergo a full exercising routine.
- 4. Maximize the amplitude of the emission by rotating the EUT, changing the antenna polarity and scanning the receive antenna height.
- 5. If the emission varies in amplitude with respect to the specification limit, the emission should be observed for at least 15 seconds and the highest reading shall be recorded, with the exception of any brief isolated high reading.
- 6. During testing the overload indicator of the test Rx should be monitored to ensure that the testing is valid., where an overload condition is suspected this can normally be confirmed by the use of external attenuation or the Rx linearity function.
- 7. If the EUT fails to meet the specification, investigations should be undertaken to ensure that the EUT has sufficient isolation from its support equipment and/ or ambient interference.
- 8. Above 1GHz Emissions that do not meet the average specification limit with a peak detector should be compared against the peak limit and re-measured with an Average detector.

FCC ID: LDK102066, Canada: 2461B-102066

- 9. Repeat steps 2 to 8 on the remaining emissions identified in the pre-assessment phase.
- 10. Record all relevant data in the eRAT.

#### Appendix E: Conducted Emissions Test Procedure

The following is a summary of the actual test procedure used by Cisco Systems (Doc No: ENG-36541)

#### Pre-Assessment

The object of the Pre-Assessment Testing is to identify emissions that must be evaluated against the specification limit, under conditions called out in the applicable standard. During this type of testing the repeatability of the test setup and the worst-case layout of the EUT are also determined..

- 1. Arrange the EUT in the chamber as defined in the configuration section of ENG-36541, the TAP and the appropriate Specification
- 2. If drive/support equipment is located outside of the shielded enclosure, care must be taken to adequately filter cables coming into the chamber to reduce any potential ambient noise.
- 3. An initial investigation should be undertaken to ensure that ambient interference from external sources or support equipment are not affecting the measured results of the EUT.
- 4. The EUT should be connected to the LISN via an appropriate length of mains power cord as defined in the Specification.
- 5. Investigations should be made to assess possible effects of I/O cables on the measured emission profile. Such investigations should remain within the boundaries of acceptable configurations defined in the Specification. The main purpose of this investigation is to check for cabling problems and for repeatability. I/O cables should not come within 80cm of the LISN (AMN) This information should be recorded in JLS.
- 6. Ensure that there is a pulse limiter in the measurement path to the input of the spectrum analyzer. Ensure that unused ports of the LISN are terminated in 50 ohms.
- 7. The emission profile of the EUT should be measured across the required frequency range.
- 8. Maximize the emission profile of the EUT over the entire frequency range. The following issues should be considered during the maximization process:
  - i. Cable placement and EUT location (within the boundaries of the Specification)
  - ii. EUT operating modes (allow for full EUT Cycle times)
- 9. Once the maximum configuration has been discovered, the emission profile should be compared with the most stringent limit from the appropriate Specification.
- 10. If no signals are within 20dB of the Specification limit no formal measurements are required. If this happens the equipment setup should be re-checked to ensure that that it has not developed a fault. When testing to CNS13438 the worst 6 emissions should be recorded regardless.
- 11. Make a Plot of the entire emission profile.
- 12. Repeat steps 9 to 11on the remaining lines.
- 13. Identify all emissions that fail to meet the most stringent limit. These emissions should be formally measured.

Page No: 141 of 150

14. Where the emission profile meets the most stringent limit, the six worst-case emissions should be identified for formal measurements. If the emission profile is broadband in Nature (i.e. switch mode PSU noise) it may be necessary to identify more than 6 emissions to adequately assess the EUT.

#### Formal Testing:

The object of Formal/Final measurements is to formally measure the emissions highlighted during the preassessment phase against the appropriate Specification limits.

- 1. Each emission identified in the pre-assessment phase should be measured against the appropriate Specification limit with a Quasi-Peak detector.
- The emissions should be observed for a sufficient period of time to allow the EUT to undergo a full exercising routine.
- 3. Where the emission varies in amplitude with respect to the Specification limit the emission should be observed for an extended time period (normally 15 seconds). The highest level observed within this 15 second period should be recorded with the exception of any brief isolated transients.
- 4. If the EUT meets the most stringent limit (e.g. the average limit) with the Quasi-Peak detector, measurements with an average detector are not necessary.
- 5. If the EUT fails to meet the most stringent limit with the Quasi-Peak detector the emission should be measured with an Average detector.
- 6. Repeat the measurements on all available power supply conductors.
- 7. If the results are within 3dB of the Specification when measured at 120V 60HZ AC measurements should also be performed at 100V 60/50Hz AC to satisfy VCCI requirements.
- 8. If the EUT fails to meet the Specification, investigations should be undertaken to ensure that the EUT has sufficient isolation from its support equipment and/ or ambient interference.
- 9. If the EUT fails to meet the CFR47 limit, investigations should be undertaken to determine if the emission is a broadband in nature. If the difference between the results obtained with the average detector and the results obtained with quasi peak detector are >6dB the emission is deemed to be broadband and the quasi peak reading can be reduced by a factor of 13dB.

### Appendix F: Scope of Accreditation: A2LA certificate number 1178-01

The Cisco Systems Scope of Accreditation for EMC testing can be found on the following web page:

http://www.a2la2.net/scopepdf/1178-01.pdf
