Emissions Test Report
Test Report #: 3056237.01
Project #s: 3056237
Date of Report: March 23, 2004
Revised: March 23, 2004
Date of Test: March 22-23, 2004

Testing performed on the
Remote Control Transmitter
Model: SOMFY
to
FCC Part 15.231 Emissions Requirements for Periodic Transmitters
and
FCC Part 15 Emissions Requirements for Unintentional Radiators
for
Harmonic Design, Inc.

Test Performed by:
Intertek – ETL SEMKO
70 Codman Hill Road
Boxborough, MA, 01719

Test Authorized by:
Harmonic Design, Inc.
12190 Tech Center Drive
Poway, CA 92064

3/24/04	Nicholas Abbondante, Test Engineer
3/30/04	Michael Murphy, Staff Engineer, EMC

2.0 General Description

2.1 Product Description

The EUT is a transmitter intended to control lighting and shades. It sends control and identification signals only. The transmitter fundamental frequency is 433.42 MHz. EUT was activated for all testing from new batteries.

The EUT has been tested at the request of

Company:	Harmonic Design, Inc. 12190 Tech Center Drive Poway, CA, 92064
Name of contact:	Mr. Eric Hauck
Telephone:	(858) 391-9085
Fax:	(858) 391-9087

2.2 Related Submittal(s) Grants

None.

2.3 Test Facility

Site 2C (Middle Site) is a 3m and 10m sheltered EMI measurement range located in a light commercial environment in Boxborough, Massachusetts. It meets the technical requirements of ANSI C63.4-1992 and CISPR 22:1993/EN 55022:1994 for radiated and conducted emission measurements. The shelter structure is entirely fiberglass and plastic, with outside dimensions of 33 ft x 57 ft. The structure resembles a quonset hut with a center ceiling height of 16.5 ft.

The testing floor is covered by a galvanized sheet metal groundplane that is earth-grounded via copper rods around the perimeter of the site. The joints between individual metal sheets are bridged with 2 inch wide metal strips to provide low RF impedance contact throughout. The sheets of metal are screwed in place with stainless steel round-head screws every three inches. Site illumination and HVAC are provided from beneath the ground reference plane through flush entry ports, the port covers are electrically bonded to the ground plane.

A flush metal turntable with 12 ft. diameter and 5000 lb. load capacity is provided for floor-standing equipment. A wooden table 80 cm high is used for table-top equipment. The turntable is electrically connected to the ground plane with three copper straps. The straps are connected to the turntable at the center of it with ground braid. A copper strap is directly connected to the groundplane at the edges of the turntable. The turntable is located on the south end of the structure and the antennas are mounted 3 and 10 meters away to the north. The antenna mast is a non-conductive with remote control of antenna height and polarization. The antenna height is adjustable from 1 to 4 meters.

All final radiated emission measurements are performed with the testing personnel and measurement equipment located below the ground reference plane. The site has a full basement underneath the turntable where support equipment may be remotely located. Operation of the antenna, turntable and equipment under test is controlled by remote controls that manipulate the antenna height and polarization with a turntable control. Test personnel are located below the ellipse when measurements are performed, however the site maintains the ability of having personnel manipulate cables while monitoring test equipment. Ambient radiated emissions are 6 dB or more below the relevant FCC emission limits.

AC mains power is brought to the equipment under test through a power line filter, to remove ambient conducted noise. 50 Hz (240 VAC single phase), 60 Hz power (120 VAC single phase, 208 VAC three phase), and 60 Hz (480 VAC three phase) are available. Conducted emission measurements are performed with a Line Impedance Stabilization Network (LISN) or Artificial Mains Network (AMN) bonded to the ground reference plane. A removable vertical groundplane (2 meter X 2 meter area) is used for line-conducted measurements for table top equipment. The vertical groundplane is electrically connected to the reference groundplane.

2.4 Test Equipment and Support Equipment

Test Equipment

There were no cables associated with the EUT					

3.0 Bandwidth
FCC § 15.231(c)

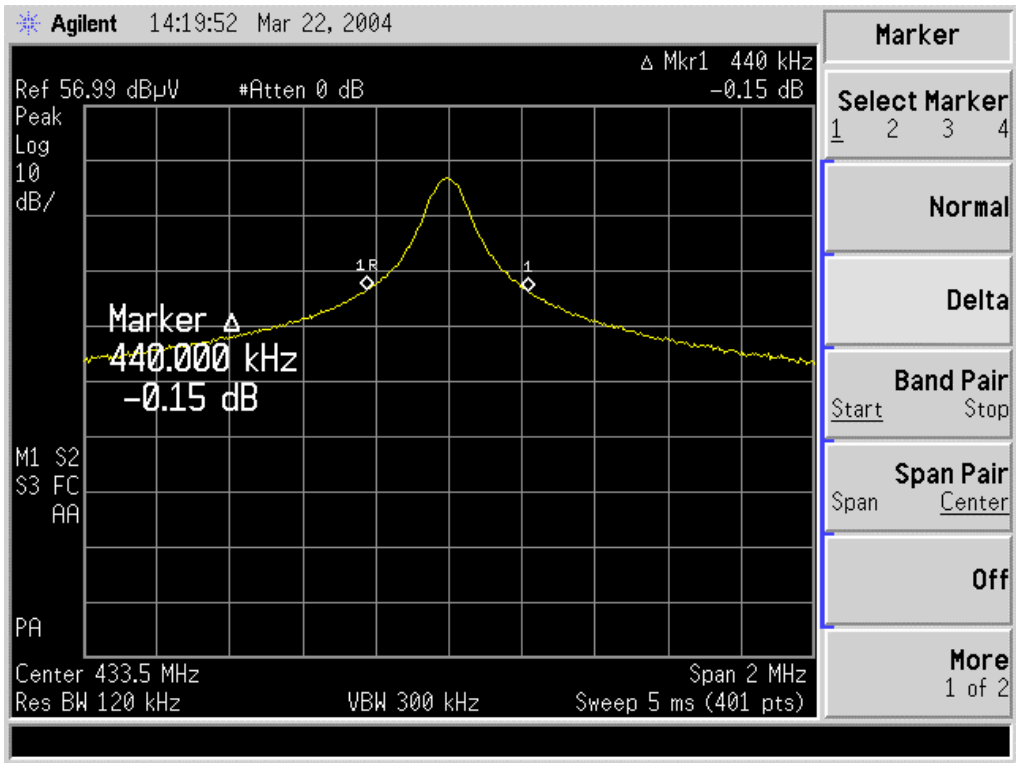
3.1 Test Procedure

The EUT was set to transmit continuously and the bandwidth was measured 20 dB down from the peak using the marker delta function. Resolution and Video bandwidth were set to 120 kHz and 300 kHz respectively.

Requirement: The bandwidth of the emission shall be no wider than 0.25% of the center frequency for devices operating above 70 MHz and below 900 MHz. For devices operating above 900 MHz, the emission shall be no wider than 0.5% of the center frequency. Bandwidth is determined at the points 20 dB down from the modulated carrier. The operating frequency is 433.42 MHz therefore the limit is 1084 kHz.

3.2 Test Results

Results: Pass			
Performed March 22, 2004	Equipment: AGL001, LOG2		
Channel	Frequency (MHz)	Bandwidth (kHz)	Limit (kHz)
433.42 MHz	433.42	440	1084



4.0 Radiated Field Strength

FCC §2.1053, §15.205, §15.209, §15.231(b)

4.1 Test Procedure

The transmitter was placed on a wooden turntable and the transmitter was activated. The measurement antenna was placed at a distance of 3 meters from the EUT. During the tests, the antenna height and polarization as well as EUT azimuth were varied in order to identify the maximum level of emissions from the EUT. The EUT was investigated in three orthogonal axes. The Peak Field Strength (FS) in the frequency range up to the tenth harmonic of the fundamental frequency was measured, as well as the associated average value.

Requirement: For a periodic transmitter, spurious emissions must be attenuated below the level of the fundamental emissions by not less than 20 dB. The fundamental field strength is based on the frequency of operation, 433.42 MHz, and corresponds to an average limit of 81.1 dBuV/m. In the restricted bands of 15.205, compliance with the stricter general limits of 15.209 is required corresponding to an average limit of 54 dBuV/m above 1 GHz. When average values are used to demonstrate compliance, peak values of the emissions must also meet a limit 20 dB higher than the average limit.

4.2 Test Results

Performed March 22-23, 2004 Equipment: AGL001, HORN1, LOG2, CBL027

Results: Pass

4.3 Sample Calculation

The following is how net radiated field strength readings were determined:

NF = RF + AF + CF - PF - AVF - DF

Where,

NF = Net Reading in dBµV/m
RF = Reading from receiver in dBµV
AF = Antenna Correction Factor in dB(1/m)
CF = Cable Correction Factor in dB
PF = Pre-Amplifier Correction Factor in dB
AVF = Duty Cycle Correction Factor in dB (only if applicable)
DF = Distance Factor in dB (using 20 dB/decade unless otherwise specified)

To convert from dBµV/m to µV/m or mV/m the following was used:

$UF = 10^{(NF / 20)}$

Where,

UF = Net Reading in µV/m

Example:

NF = RF + AF + CF - PF - AVF - DF = 62.9 + 13.7 + 2.1 - 16.1 - 0.0 - 10.5 = 52.1 dBµV/m

$UF = 10^{(52.1\ dB\mu V / 20)} = 403\ \mu V/m$

4.4 Configuration Photographs – Radiated Emissions

Radiated Spurious Test Setup, Front View

Radiated Spurious Test Setup, Back View

5.0 Line-Conducted Emissions

FCC § 15.107, § 15.207

5.1 Test Procedure

Conducted emissions are measured in the frequency range of 150 kHz to 30 MHz on AC power lines. Interference voltages are measured with a LISN and a spectrum analyzer or receiver. The handset and base were placed 40cm from a vertical ground plane on a non-conductive table at an 80cm height over a conductive ground plane.

Requirement: Line-conducted emissions must not exceed the CISPR 22 limits.

Frequency (MHz)	**Class B Limit dB(µV)**	
	Quasi-Peak	Average
0.150 – 0.5	66 – 56*	56 – 46*
0.5– 5	56	46
5– 30	60	50

*-Decreases linearly with the logarithm of the frequency

5.2 Test Results

Results: N/A

Testing was not performed as the EUT is battery powered.

5.3 Sample Calculation

The following is how net line-conducted readings were determined:

NF = RF + LF + CF + AF

Where,

NF = Net Reading in dBµV
RF = Reading from receiver in dBµV
LF = LISN Correction Factor in dB
CF = Cable Correction Factor in dB
AF = Attenuator Loss Factor in dB

To convert from dBµV to µV or mV the following was used:

$UF = 10^{(NF / 20)}$

Where,

UF = Net Reading in µV

Example:

NF = RF + LF + CF + AF = 28.5 + 0.2 + 0.4 + 20.0 = 49.1 dBµV

$UF = 10^{(48.1\ dB\mu V / 20)} = 254\ \mu V/m$

5.4 Configuration Photographs – Line-Conducted Emissions
